

Integrate electronic signatures seamlessly into your application.

The Signing Widget from sproof sign enables the direct integration of eIDAS-compliant electronic signatures (AES, QES) in any application and website. In contrast to conventional signature workflows, where signatories receive an invitation to sign via separate channels such as e-mail or SMS, users remain in the existing environment with the Signing Widget.

The signature process can be seamlessly integrated into a system via the API, and the user interface can be customized to enable tailored user journeys. The Signing Widget is particularly suitable for web applications that regularly generate contracts or other documents that need to be signed by the users themselves.

Benefits at a glance:

- **Seamless integration:** All e-signature standards directly in the application, without media disruptions.
- **Flexibility and customizability:** The widget can be adapted to any company branding and specific requirements, including the design of individual customer journeys for different use cases.
- **Better conversion rate:** Lower abandonment rate due to external signature links or systems
- **Security and compliance:** 100% GDPR, eIDAS and FDA compliant, with guaranteed data storage within Europe.

Signing Widget - Example case 1

Integration of the E-Signatur in DMS

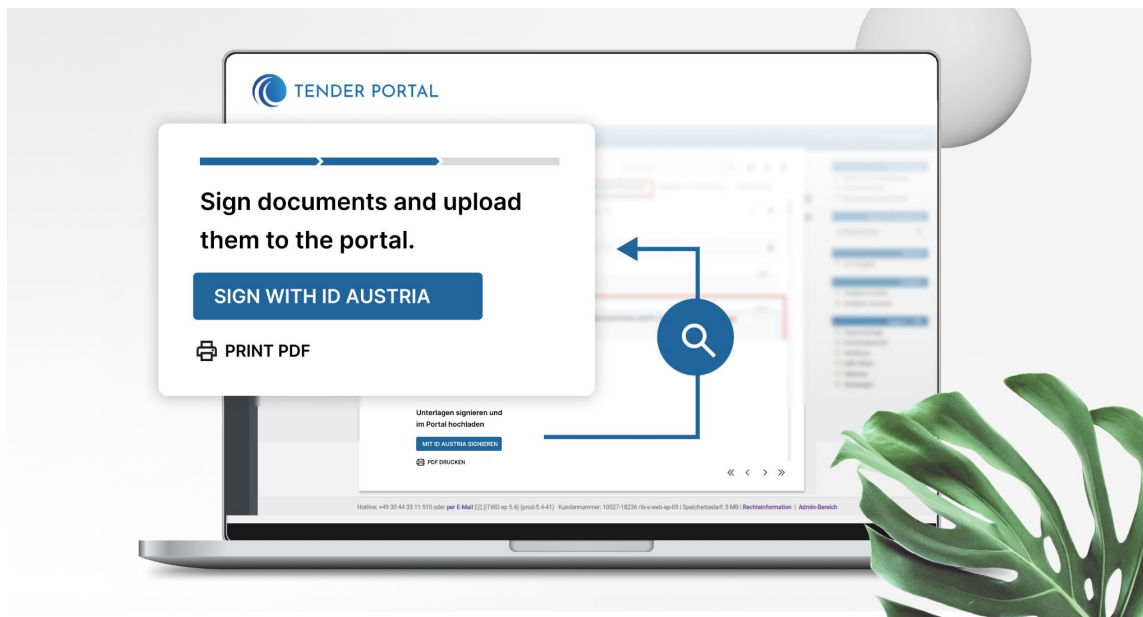

By integrating the signing widget into a DMS, PDF documents can be signed easily and efficiently with legal validity. Using the “Further actions” function, the digital signature can be triggered with a single click without having to leave the DMS environment. A digital signature that meets the highest legal standards is applied to the document in the background.

Custom User Journey:

- Click on “Further actions” in the DMS
- Select the “Sign” option
- Legally sign a PDF document with one click
- PDF document can be verified in any signature verification tool

Signing Widget - Example case 2

Integration of the E-Signatur in the tender portal

In a tender portal, the signing widget ensures a smooth electronic submission process. As soon as a document is to be submitted, the user can start the signature process directly from the portal with a single click. The approval or signature process is completed immediately and with legal validity.

sproof supports all leading Trust Service Providers (TSP), including ID Austria, D-Trust and many more, for the integration of qualified signatures into the portal. This flexibility makes it possible to map even highly specific requirements such as the use of national identification and signature services.

Custom User Journey:

- Signature at the end of the submission process
- Integration of a national eID, e.g. ID Austria
- Login with the ID Austria access data
- Qualified electronic signature is triggered in the background

For Developer

Step-by-step integration into your application

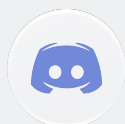

- 1) **Create signature widget:** The widget is created with all the necessary parameters via the sproof API.
- 2) **Customize signature widget:** Custom user journey: The signature process can be individually defined.
- 3) **Corporate design:** Colors, logos and fonts can be adapted to ensure seamless integration into the existing application.
- 4) **Embed signature widget:** The widget can be flexibly integrated as a button, iFrame or in another form.
- 5) **Retrieve signatures:** Signed documents and verification data can be accessed at any time via the API.

Personal consultation & test environment:

We will be happy to advise you personally and evaluate a possible implementation of your use cases together. We will be happy to provide you with a free test environment.
